

Web Application Testing

Features

- ▶ Thorough, expert testing by highly skilled test team
- ▶ Rapid turnaround
- ▶ Competitive cost, even compared to off-shore

Benefits

- ▶ Ensure your web site meets your user's expectations
- ▶ Lets you focus on your core competencies

Incorporating sophisticated applications and technologies into your web site creates a critical requirement for a quick, efficient, cost-effective testing solution. QualityLogic combines extensive testing expertise with in-depth knowledge of Internet technologies to bring you the best solution to meet your quality goals, budget and schedule.

Our skilled testers provide a high level of expertise at costs that are competitive with off-shore facilities, but without the language and time difference issues. Don't trust your product to someone that tests web applications as a sideline. Web testing is our chosen profession, and the quality shows.

We provide testing services for major web sites that incorporate a high level of complexity. Major clients include leading companies in entertainment, consumer products and technology industries.

We create a structured test plan and execute it from your site user's perspective to test the complete site, including all sub-pages within the site. We thoroughly test your site's functionality, compatibility with a wide variety of operating systems and browsers, and verify its content.

Add Value through Testing

Here are a few ways we increase the value of your web-based initiatives:

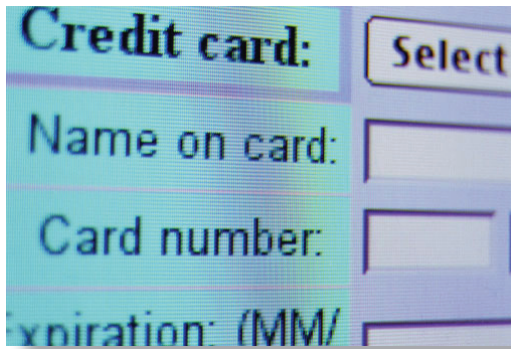

- ▶ Daily monitoring of video content feeds - Each day, we check available streaming video feeds to verify expected content updates have been applied for that day or your specified release date.

- ▶ Ad hoc or structured testing of massive multi-player games - We place multiple testers into the game environment to seek out content and functionality issues that can only be detected during actual game play. Game continuity is tested by following designed linear paths, as well as non-linear paths that a player may choose. Environment boundaries are checked for possible exit/cheat points. All game components are checked for content and functionality.
- ▶ Testing mobile web clients in an on-line financial transactional environment - Using multiple devices on live accounts, we access your mobile commerce site to verify transactions function as expected and complete successfully. Your client application can be functionality tested from end to end.
- ▶ EStore functionality - We verify that your on-line store transactions function as expected and complete successfully. We test the commerce process from end to end, including verification of product content.
- ▶ Automation of repetitive testing tasks - We develop automated test scripts that simplify repetitive tests and shorten execution times, saving you money.
- ▶ Load time performance monitoring - Using system monitoring software we provide an "external" view of how your site loads on a customer's PC.
- ▶ Daily/Weekly/Monthly content update verification - We can schedule daily testing to verify your web content updates are applied accurately.

Web Application Testing

- ▶ Search function results testing - We test your embedded search engine against common/uncommon search strings to verify that it returns accurate results.
- ▶ Page hit tracking verification - Hit tracking services can provide inaccurate hit counts for your web pages. We verify the accuracy of your service by comparing their results against our actual page hits.

- ▶ Desktop application interface testing (Adobe AIR/Silverlight) – We thoroughly test new desktop applications for functionality and content.
- ▶ Link Verification - We verify every link on your web site and provide a report indicating invalid/inactive links.
- ▶ Embedded page object functionality - As you develop and deploy individual page objects to your site, we test and verify their functionality.
- ▶ Application to Web interconnect - If your client application uses web access, we can verify that access functions and is seamless to your customers.
- ▶ Flash based game testing – We test in multiple browser, operating system, and hardware environments.
- ▶ Cross browser functionality testing - We test your product in virtually any browser to ensure it functions properly in the environments you choose to support.

- ▶ Competitive analysis - We provide an independent, head-to-head comparison of your site's functionality, usability and performance compared to your competitors.

Operating Systems

QualityLogic maintains developer subscriptions with Microsoft and Apple that

allow us access to virtually any Windows or Mac operating system. Operating systems currently being used in testing include:

- ▶ Windows 2000 Professional
- ▶ Windows XP (Home/Professional)
- ▶ Windows Vista (All)
- ▶ Mac OS 10.4 (Tiger)
- ▶ Mac OS 10.5 (Leopard)
