PDF 2.0 ATS Overview

Application Test Suites (ATS) from QualityLogic are a complete and affordable solution for testing your printer, MFP, or software product for compatibility with popular applications. The QualityLogic ATS products for PDF are comprehensive collections of test pages developed using applications from Adobe®, Corel®, Microsoft®, and Quark® designed to help you ensure compatibility in the real world with the applications your customers will use with your product.

Improves Time-To-Market

QualityLogic's ATS products are provided in captured print ready format, so you don't have to purchase dozens of applications and develop test pages. This accelerates your development cycle and saves you money and valuable engineering time.

Support for PDF and PCLm

Our most recent ATS products are available for PDF and PCLm using a suite of PDF printers as a reference including Adobe Embedded Print Engine, Qualcomm, Artifex, and Lexmark's PDF interpreters.
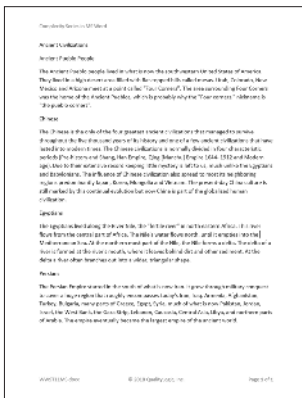

By including different PDF reference printers, you will have access to the best of breed implementations to test your device against.

Wide Range of Applications

QualityLogic has the largest collection of application test pages in the world. Our software library covers applications ranging from word processing and page layout, to spreadsheets, graphic arts, design, engineering, and small office/home office programs. Our latest version uses brand new test pages from 22 different Windows applications.
Optimized Test Page Design

QualityLogic's ATS products offer three different types of test pages—progressive complexity, real-world, and mechanical—to create a complete and diverse testing environment. This approach allows the QualityLogic ATS to fully exercise the printable features of the applications supported.

"Progressive complexity" pages (above) increase the complexity of a page design over several files for performance testing.
